QA Test Summary Report

Project: Vrit Technologies – Signup and Registration Workflow
Application: Authorized Partner (https://authorized-partner.vercel.app/)
Tester: Akshita Oli | **Date:** 2 November 2026
Environment: [Chrome150.0.7871.125], [Windows (x86)11]

1. **Scope**

   Manually tested the end-to-end signup flow (from terms to profile completion, including email/document verification), navigation, UI/UX, and edge cases like duplicate data. Lacking formal requirements, expected outcomes were inferred from app behavior, common web standards, and reasonable user expectations.

2. Results

Total cases	Passed	Failed	Blocked	Pass rate
61	59	2	0	96.7%

All 61 cases were executed. Evidence is attached for each failure.

3. Top 3 risks

1. **Phone Number Error (High Severity / High Priority):** Leaving the optional phone number blank blocks the signup. The system wrongly submits just the country code (+977) and shows a "number already exists" error.
2. **Unclear Required Fields (Low Severity / Medium Priority):** Required and optional fields look exactly the same. Users only find out a field is mandatory after trying to submit and getting an error.
3. **Data Loss on Refresh:** Refreshing the "Verification" page clears all the data the user just typed. We need developer confirmation on whether this is intended behavior.

4. What was not tested, and why

- **Load, performance and security testing:** outside the task, and the site asked testers to avoid load or spam.
- **Other browsers and real mobile devices:** only one browser and a resized window were used.
- **Admin approval of a “Pending” account:** no admin access, so the step after submission could not be verified.
- **Email content and delivery speed:** only the arrival and use of the verification code were checked.
- **Accessibility (screen readers, contrast):** not part of the task scope.
